2	baseline_outcomes	3
3	numerical_diagnostics	4

1 baseline_college_work_choice

Table 1: College vs. Work Decisions in the Baseline

Decision	Number	Share (%)
College	222	4.4
Work	4,778	95.6
Total	5,000	100.0

Note: Number and share of individuals choosing each post-family-stage path in the baseline simulation.

2 baseline_outcomes

Table 2: End-of-Family Outcomes: Baseline

Outcome (at $t = 18$)	Baseline
Mean final assets ^a	203.27
Mean final human capital	3.3482

^a Values in thousands of U.S. dollars.

Note: Means computed over the simulated cohort at the end of the family stage.

3 numerical_diagnostics

Table 3: Numerical Diagnostics

Diagnostic	Value
Minimum converged share (parent solve)	1.0000
Bellman residual, max (child work path)	5.77e-13
Bellman residual, mean	1.00e-13
Monotonicity violations, V in assets	0.01%
Monotonicity violations, c in assets	4.02%
Simulated assets below $a_{\min}$	0.00%
Simulated assets above $a_{\max}$	0.00%
Mean terminal parental assets	20.3271
Bootstrap standard error	0.1128

Note: Computed on the solved model and the simulated cohort. Bellman residuals are relative; standard errors are bootstrapped over 200 resamples.
